# **Test Results Analysis**

DC fast charging at temperature testing includes tests that measure the charge duration, energy transfer, and energy used to thermally regulate the energy storage system (ESS) for charge events at 0, 25 and 50 °C.<sup>6</sup> The objective of this testing is to provide analysis about the effects of ambient temperature on DC fast charge-capable vehicles. These tests were performed as part of the US Department of Energy Advanced Vehicle Testing Activity, which is conducted by Idaho National Laboratory and the Intertek Center for Evaluation of Clean Energy Technology (CECET).

#### **Test Results: Energy and SOC**

Figures 1a, 1b, and 1c show the energy transferred to each vehicle and the change in state of charge (SOC) over the duration of each charge event for each of the specified temperatures. Each DC fast charge event consists of an initial charge event and a top-off charge event.<sup>8,9</sup> The end of the initial charge is denoted by a dashed oval. Many vehicle manufacturers report the time required for a charge of the ESS to 80% SOC as being 30 minutes; for VIN 3178, the SOCs recorded at the 30-minute mark for the 0, 25 and 50 °C tests were 65.0%, 87.5%, and 67.0%, respectively. For VIN 4550, the SOCs recorded at the 30-minute mark for the 0, 25 and 50 °C tests were 62.0%, 86.5%, and 61.0% respectively.

Figure 1a. 0 °C charge energy and SOC versus time

Figure 1b. 25 °C Charge energy and SOC versus time

Figure 1c. 50 °C Charge energy and SOC versus time

### **Test Results: Temperatures**

Tables 1 and 2 show the initial, final, and maximum cell temperatures of each vehicle's ESS during charging events.

Table 1. VIN 3178 ESS cell temperature during BOT test

Test Temp. (°C)	ESS Cell Initial Temp. (°C)	ESS Cell Final Temp. (°C)	ESS Cell Maximum Temp. (°C)
0 °C	4	14	15
25 °C	26	36	36
50 °C	49	49	49

Table 2. VIN 4550 ESS cell temperature during BOT test

Test Temp. (°C)	ESS Cell Initial Temp. (°C)	ESS Cell Final Temp. (°C)	ESS Cell Maximum Temp. (°C)
0 °C	3	13	13
25 °C	27	37	37
50 °C	49	49	49

## **Test Results: Charge Power**<sup>10,11</sup>

Figures 2a, 2b, and 2c show the power at which each vehicle's ESS was being charged for each of the specified temperatures. As before, the end of the initial charge event is denoted by a dashed oval.

Figure 2a. 0 °C Charge power profiles

Figure 2b. 25 °C charge power profiles

Figure 2c. 50 °C charge power profiles

	ΓES:		
1.	Vehicle, ESS, and DCFC details were either supplied by t	he manufacturer or derived from a literature review.
