## PERFORMANCE STATISTICS ${ }^{3}$

| TRACK TESTING ${ }^{4}$ | DYNAMOMETER TESTING ${ }^{9}$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Acceleration 0-60 mph ${ }^{5}$ | Cycle Results ${ }^{10}$ |  |  |  |
| Measured Time: 10.9 s |  | $72{ }^{\circ} \mathrm{F}$ | $20^{\circ} \mathrm{F}$ | $95^{\circ} \mathrm{F}+850 \mathrm{~W} / \mathrm{m}^{2}$ |
| Performance Goal: $\leq 13.5$ s | UDDS <br> (Cold Start) | 243.9 Wh/mi | 582.6 Wh/mi | 312.8 Wh/mi |
|  | UDDS | 235.3 Wh/mi | 479.1 Wh/mi | 301.5 Wh/mi |
| Maximum Speed | HWFET | 261.5 Wh/mi | 411.5 Wh/mi | 298.1 Wh/mi |
| At $1 / 4 \mathrm{Mile}$ : 80.1 mph | US06 | 355.0 Wh/mi | 476.1 Wh/mi | 400.1 Wh/mi |
| At 1 Mile ${ }^{6}$ : 85.1 mph | SC03 |  |  | 315.6 Wh/mi |

Performance Goal: $\geq 90 \mathrm{mph}$ at 1-mile mark

## Braking at $50 \%$ SOC from $\mathbf{6 0 - 0} \mathrm{mph}^{7}$

Measured Time: 3.6 s
Distance: 137.0 ft
Peak Power into Battery: 52.9 kW
Braking at 100\% SOC from $\mathbf{6 0 - 0} \mathrm{mph}^{7}$
Measured Time: 3.6 s
Distance: 139 ft
Peak Power into Battery: 54.0 kW
Deceleration 60-10 mph ${ }^{8}$
Measured Time: 61.4 s
Distance: 2,688 ft
Peak Power into Battery: 13.7 kW
Total Energy into Battery: 102.0 Wh

| City Range | 110.9 miles | US06 Range | 74.1 miles |  |
| :---: | :--- | :--- | :--- | :---: |
| Highway Range | 100.7 miles |  |  |  |
|  |  |  |  |  |

Energy Consumption at Steady-State Speed, 0\% Grade

| 10 mph | $149.9 \mathrm{~Wh} / \mathrm{mi}$ |  | 50 mph | $253.6 \mathrm{~Wh} / \mathrm{mi}$ |
| :---: | :--- | :--- | :--- | :--- |
| 20 mph | $151.4 \mathrm{~Wh} / \mathrm{mi}$ |  | 60 mph | $306.8 \mathrm{~Wh} / \mathrm{mi}$ |
| 30 mph | $174.1 \mathrm{~Wh} / \mathrm{mi}$ |  | 70 mph | $356.6 \mathrm{~Wh} / \mathrm{mi}$ |
| 40 mph | $194.5 \mathrm{~Wh} / \mathrm{mi}$ |  | 80 mph | $433.8 \mathrm{~Wh} / \mathrm{mi}$ |

Duration of Passing Maneuver at Grade ${ }^{11}$

|  | $0 \%$ Grade | $3 \%$ Grade | $6 \%$ Grade |
| :---: | :---: | :---: | :---: |
| $35-55 \mathrm{mph}$ | 4.1 s | 4.7 s | 5.7 s |
| $55-65 \mathrm{mph}$ | 3.0 s | 3.6 s | 4.9 s |
| $35-70 \mathrm{mph}$ | 8.6 s | 10.5 s | 14.0 s |
| $55-80 \mathrm{mph}$ | 9.0 s | 12.3 s | 20.8 s |
| Maximum Speed at $25 \%$ Grade from Stop: 41.4 mph |  |  |  |

NOTES (also from previous page):

1. Vehicle specifications were supplied by the manufacturer, measured, or derived from a literature review.
2. The vehicle was classified as a Type II ZEV by the California Air Resources Board (CARB). The range on consecutive UDDS cycles is over 100 miles (less than 200 miles), but the vehicle does not meet the charging requirements for the Type III classification.
3. Performance numbers based on "Normal" vehicle mode. Performance numbers are averages from multiple tests.
4. Vehicle track testing occurs when the vehicle has achieved its "break-in mileage" of between 4,000 to 6,000 miles, and at the delivered curb weight plus $332 \pm 10 \mathrm{lb}$ (including driver and test equipment), distributed in a manner similar to the original curb loading of the vehicle. Track testing took place between July 2 and July 11, 2014 with a beginning vehicle odometer reading of 4,055 miles. The ambient temperatures ranged from $81^{\circ} \mathrm{F}$ to $97^{\circ} \mathrm{F}$. No accessories were used except for headlights as required by track regulation.
5. The acceleration is measured from the point at which the vehicle begins to move. The acceleration and maximum speed results were averaged from 13 runs. The peak power value was taken from a single run.
6. The maximum speed was reached before the one-mile mark.
7. Controlled braking on dry surface. Brake testing was performed when the battery was at $50 \%$ state of charge (SOC) and also at $100 \%$ SOC. The peak power into the battery value was taken from a single run.
8. Coasting in drive on dry surface. Test run data were cut off when the vehicle reached 10 mph , as vehicle creep speeds are typically below this threshold. The time and distance results were averaged from 12 runs. The peak power into the battery value and total energy into the battery value were both taken from a single (but different) run.
9. Dynamometer testing occurs after the track testing is complete. Dynamometer testing began on August 8,2014 , with the vehicle odometer reading 4,524 miles. A comprehensive explanation of the dynamometer facility and methodology can be found at http://www.transportation.anl.gov/D3/, titled "Chassis Dynamometer Testing Reference Document". The ABC coefficients derived from track coastdown testing and matched on the dynamometer were $\mathrm{A}: 36.4265 \mathrm{lb}, \mathrm{B}: 0.51941 \mathrm{lb} / \mathrm{mph}$, and $\mathrm{C}: 0.015143 \mathrm{lb} / \mathrm{mph} 2$. All electrical consumption values are given in $\mathrm{AC} \mathrm{Wh} / \mathrm{mi}$.
10. The Cycle Results table presents the fuel economy achieved by the vehicle on five EPA drive cycles at three different ambient temperatures: (1) $72^{\circ} \mathrm{F}$ with vehicle climate-control off, (2) $20^{\circ} \mathrm{F}$ with vehicle climate-control set to $72{ }^{\circ} \mathrm{F}$ Auto, and (3) $95^{\circ} \mathrm{F}$ with vehicle climate-control set to $72{ }^{\circ} \mathrm{F}$ Auto. For (3), the vehicle is also subjected to $850 \mathrm{~W} / \mathrm{m} 2$ of solar load at $95^{\circ} \mathrm{F}$ to simulate direct sunlight. The drive cycles include a hot start unless otherwise indicated. The ranges are calculated using SAE J1634, and are for a temperature of $72{ }^{\circ} \mathrm{F}$.
11. The passing maneuver value indicates the amount of time required for the vehicle to transition from the first to the second speed, at the specified grade.

Values in red indicate that the Performance Goal was not met.

CONSTANT-SPEED RANGE AND CHARGE TESTING IN CHARGE-DEPLETING MODE ${ }^{1}$

|  | 45 mph Test ${ }^{2}$ | $60 \mathrm{mph} \mathrm{Test}{ }^{3}$ | 70 mph Test ${ }^{4}$ |
| :---: | :---: | :---: | :---: |
| Average DC power out of battery at speed (kW): | 9.0 | 16.3 | 22.7 |
| (A) DC energy out of battery at set speed (kWh $)^{5,7,9}$ : | 19.2 | 19.3 | 18.7 |
| $\left(\mathbf{A + )}\right.$ Total DC energy out of battery (kWh) ${ }^{5,7,9}$ : | 19.5 | 19.7 | 19.4 |
| Battery capacity discharge at set speed (Ah): | 59.5 | 60.2 | 58.5 |
| (B) $\quad$ Range at set speed (mi) ${ }^{6,8,10}$ : | 97.1 | 71.7 | 57.6 |
| (C) Post-test charge AC energy from EVSE @ 240 V to onboard charger ( kWh ): | 25.4 | 25.0 | 24.8 |
| (D) Post-test charge DC energy into battery from onboard charger (kWh): | 20.5 | 20.5 | 20.3 |
| Post-test charge duration (HH:MM): | 04:15 | 04:28 | 04:25 |
| AC electricity consumption rate ( $\mathrm{Wh} / \mathrm{mi})^{11}$ : | 258 | 342 | 415 |
| DC electricity consumption rate ( $\mathrm{Wh} / \mathrm{mi})^{12}$ : | 198 | 269 | 325 |
| (A+/D) Battery Roundtrip Efficiency ${ }^{13}$ : | 95\% | 96\% | 96\% |
| (D/C) On-Board Charger Efficiency ${ }^{14}$ : | 81\% | 82\% | 82\% |
| ( $\mathrm{A}+/ \mathrm{C}$ ) Overall Trip Efficiency ${ }^{15}$ : | 77\% | 79\% | 78\% |

NOTES:

1. See Note 3 and Note 4 on page 2. The vehicle is accelerated to the desired speed and then cruise control is used to maintain the speed. Range is considered reached when the vehicle is no longer capable of maintaining a speed that is 2 mph lower than the set speed.
2. During the 45 mph range test, the maximum battery temperature was $34^{\circ} \mathrm{C}$ and the average ambient temperature was $28^{\circ} \mathrm{C}$. During the post-test charge, the maximum battery temperature was $37^{\circ} \mathrm{C}$, and the average ambient temperature was $31^{\circ} \mathrm{C}$.
3. During the 60 mph range test, the maximum battery temperature was $36^{\circ} \mathrm{C}$ and the average ambient temperature was $29^{\circ} \mathrm{C}$. During the post-test charge, the maximum battery temperature was $38^{\circ} \mathrm{C}$, and the average ambient temperature was $36^{\circ} \mathrm{C}$.
4. During the 70 mph range test, the maximum battery temperature was $33^{\circ} \mathrm{C}$ and the average ambient temperature was $29^{\circ} \mathrm{C}$. During the post-test charge, the maximum battery temperature was $38^{\circ} \mathrm{C}$, and the average ambient temperature was $34^{\circ} \mathrm{C}$.
5. In addition to the energy discharged from the battery during the 45 mph test, energy was discharged during the drive from test prep area to point at which vehicle test speed is achieved and maintained. After the range at 45 mph was completed, there is still ESS energy throughput during the drive to return the vehicle to the test prep area and the EVSE unit for the post-test charge. The pre-test drive required 0.31 kWh while the post-test drive returned 0.06 kWh , and these energy inputs can be added to the energy consumed during the range test $(\mathbf{A})$ to obtain the total output from the battery $(19.5 \mathrm{kWh}$, denoted as $(\mathbf{A}+)$ ) that is used in the calculations discussed in Notes 13-15.
6. In addition to the range measured for the 45 mph test, the pre-test drive required 1.02 miles from test prep area to point at which vehicle test speed is achieved and maintained. After the range at 45 mph was completed, the post-test drive required an additional drive of 0.80 miles to return to the test prep area and the EVSE unit for the post-test charge. These distances can be added to the distance traveled during the range test (B) to obtain the total distance traveled ( 98.9 miles). However, the energy consumption values consider only the distance traveled during the test itself, or value (B).
7. In addition to the energy discharged from the battery during the 60 mph test, energy was discharged during the drive from test prep area to point at which vehicle test speed is achieved and maintained. After the range at 60 mph was completed, there is still ESS energy throughput during the drive to return the vehicle to the test prep area and the EVSE unit for the post-test charge. The pre-test drive required 0.46 kWh while the post-test drive returned 0.02 kWh , and these energy inputs can be added to the energy consumed during the range test $\mathbf{( A )}$ ) to obtain the total output from the battery $(19.7 \mathrm{kWh}$, denoted as $(\mathbf{A}+)$ ) that is used in the calculations discussed in Notes 13-15.
8. In addition to the range measured for the 60 mph test, the pre-test drive required 1.17 miles from test prep area to point at which vehicle test speed is achieved and maintained. After the range at 60 mph was completed, the post-test drive required an additional drive of 2.53 miles to return to the test prep area and the EVSE unit for the post-test charge. These distances can be added to the distance traveled during the range test (B) to obtain the total distance traveled ( 75.4 miles). However, the energy consumption values consider only the distance traveled during the test itself, or value (B).
9. In addition to the energy discharged from the battery during the 70 mph test, energy was discharged during the drive from test prep area to point at which vehicle test speed is achieved and maintained. After the range at 70 mph was completed, there is still ESS energy throughput during the drive to return the vehicle to the test prep area and the EVSE unit for the post-test charge. The pre-test drive required 0.71 kWh while the post-test drive returned 0.02 kWh , and these energy inputs can be added to the energy consumed during the range test $\mathbf{( A )}$ ) to obtain the total output from the battery $(19.4 \mathrm{kWh}$, denoted as $(\mathbf{A}+)$ ) that is used in the calculations discussed in Notes 13-15.
10. In addition to the range measured for the 70 mph test, the pre-test drive required 1.73 miles from test prep area to point at which vehicle test speed is achieved and maintained. After the range at 70 mph was completed, the post-test drive required an additional drive of 1.09 miles to return to the test prep area and the EVSE unit for the post-test charge. These distances can be added to the distance traveled during the range test $\mathbf{( B )}$ ) to obtain the total distance traveled ( 60.4 miles). However, the energy consumption values consider only the distance traveled during the test itself, or value (B).
11. The AC electricity consumption rate is calculated by dividing the DC electricity consumption rate (in $\mathrm{Wh} / \mathrm{mi}$ ) by the Overall Trip Efficiency for that particular speed.
12. The DC electricity consumption rate is calculated by dividing the DC energy from the battery as the set speed (A) by the range at the set speed (B).
13. Battery Roundtrip Efficiency is calculated by dividing the DC energy out of the battery ( $\mathbf{A}+$ ) by the DC energy from the on-board charger into the battery (D).
14. On-Board Charger Efficiency is calculated by dividing the DC energy from the on-board charger into the battery (D) by the AC energy from the EVSE (C).
15. Overall Vehicle Efficiency is calculated by dividing the DC energy out of the battery (A+) by the AC energy from the EVSE (C).

As a production vehicle, this vehicle is assumed to meet all Federal Motor Vehicle Safety Standards (FMVSS) for Battery Electric Vehicles.
