

Saturn Vue Hybrid Electric Vehicle Accelerated Testing – April 2010

Two model year 2007 Saturn Vue hybrid electric vehicles (HEVs) entered Accelerated testing during November 2006 in a fleet in Arizona. Each Vue was scheduled for 160,000 miles of operations, at which point their traction batteries would be tested before they are retired. However, one Vue was totaled at 103,000 miles in June 2009. One page vehicle maintenance logs have been posted on nearby www pages. This information includes the date and mileage for all maintenance and repairs performed on the vehicles. At test completion, the two Vue HEVs were driven a total of 263,000 miles and the cumulative average fuel economy is 26.5 mpg.
