Idaho National Laboratory

- U.S. Department of Energy (DOE) laboratory
- 890 square mile site with 4,000 staff
- Support DOE’s strategic goal:
  - Increase U.S. energy security and reduce the nation’s dependence on foreign oil
- Multi-program DOE laboratory
  - Nuclear Energy
  - Fossil, Biomass, Wind, Geothermal and Hydropower Energy
  - Advanced Vehicle Testing Activity & Battery Testing
  - Homeland Security and Cyber Security
Vehicle / Infrastructure Testing Experience

• Since 1994, INL staff have benchmarked PEVs with data loggers in the field, and on closed test tracks and dynamometers

• INL has accumulated 250 million PEV miles from 27,000 electric drive vehicles and 16,600 charging units
  – EV Project: 8,228 Leafs, Volts and Smarts, 12,363 EVSE and DCFC
    • 4.2 million charge events, 124 million test miles. At one point, 1 million test miles every 5 days
  – Ford, GM, Toyota and Honda requested INL support identifying electric vehicle miles traveled (eVMT) for 15,721 new PHEVs, EREVs and BEVs
    • Total vehicle miles traveled (VMT): 158 million miles

• INL also tests HEVs, NEVs, HICEs, charging infrastructure and other advanced technology vehicles with petroleum reduction technologies
Background on PEVs
Nomenclature

- PEV (plug-in electric vehicle) are defined as any vehicle that connects or plugs in to the grid to fully recharge the traction battery pack
  - BEVs: battery electric vehicle (no internal combustion engine ICE)
  - EREV: extended range electric vehicles (operates on electric first and when electric range has been exceeded, operates like a normal hybrid electric vehicle)
  - PHEVs: plug-in hybrid electric vehicles (blended electric and ICE operations in various schemes)

- Charging infrastructure
  - DCFC: high voltage DC fast chargers 440V
  - Level 2 EVSE: AC 208/240V electric vehicle supply equipment
  - Level 1 EVSE: AC 110/120V electric vehicle supply equipment

PEV Reported Charging Locations

- DOE Alternative Fuels Data Center - Electric Vehicle Charging Station Locations
  - [http://www.afdc.energy.gov/fuels/electricity_locations.html](http://www.afdc.energy.gov/fuels/electricity_locations.html)
  - 10,003 electric stations and 25,958 charging outlets (excludes private locations) in the United States
  - Interactive map that provides additional information for each location
  - (Note that these are self reported stations)
National Look at Public Charging & Installation Costs
Defining Public Venues

• Venue definition was originally different across all EVSE (electric vehicle supply equipment & DCFC (direct current fast charger) studies & deployments

• INL settled on venues mostly defined in NYSERDA deployment

• Primary Venues used to define AeroVironment & Blink EVSE & DCFC used in the The EV Project, ChargePoint America, and West Coast Electric Highway projects:
  – Education: Training facilities, universities, or schools
  – Fleet: EVSE known to be used primarily by commercial or government fleet vehicles
  – Hotels: Hotel parking lots provided for hotel patron use
  – Leisure Destination: Parks and recreation facilities or areas, museums, sports arenas, or national parks or monuments.
  – Medical: Hospital campuses or medical office parks
  – Multi-Family: Parking lots serving multi-family residential housing (also referred to as multi-unit dwellings)
Defining Public Venues – cont’d

- **Primary Venues cont’d:**
  - **Non-Profit Meeting Places:** Churches or charitable organizations
  - **Parking Lots/Garages:** Parking lots or garages that are operated by private parking management companies, property management companies, or municipalities that offers direct access to a variety of venues
  - **Public/Municipal:** City, county, state, or federal government facilities
  - **Retail:** Retail locations both large and small, such as shopping malls, strip malls, and individual stores
  - **Transportation Hub:** Parking locations with direct pedestrian access to other forms of transportation, such as parking lots at airports, metro-rail stations, or ferry port parking lots
  - **Workplace:** Business offices, office parks or campuses, or industrial facilities
Public EVSE Charging Venues

- EVSE & DCFC sites discussed here were comprised of as few as one EVSE and as many as 18 EVSE per site
- The first four weeks of usage of EVSE at a site were not included in the calculation of performance metrics for that site
- The subset of data chosen for this research was restricted between September 1, 2012, and December 31, 2013
- 774 public Level 2 (240V) sites in primary venues
- The retail and parking lots/garages venues contained over 45% of all Level 2 sites
Public EVSE Venue Frequency of Charge Events

- Average charging events per week per site (white circles)
- The range is the colored bar
- One retail venue averaged 40 average events per week
- The top 7 workplace sites averaged over 40 charging events per week
Public DCFC Use (Direct Current Fast Charger)

- 102 AeroVironment & Blink DCFC average number of charging events per week per site for DCFC sites by venue
- The retail venue contains 62% of all deployed DCFC
Publicly Accessible DCFC Use

- The site with the most usage is at a workplace venue
- DCFC utilization ranged from 3 to just over 60 charging events / week
- Workplace and education venues had the highest median charging frequency at 25 & 38 events per site per week
Analyzing Public Charging Venues: Summary

• Aspects of location may contribute to an EVSE site’s popularity (or lack thereof), such as:
  – Site’s geographic proximity to a large business district or an interstate highway
  – The general location of the EVSE site, such as the part of town, city, or region where it is located, may also influence its use
  – Demographics of local drivers or commuting drivers to workplaces and local commercial venues
• Defining the “best” location for EVSE is a complex undertaking
Businesses, government agencies, & other organizations have many reasons for providing EVSE. Their definition of the “best” location for EVSE varies:

- Some are concerned with installing EVSE where it will be highly used & provide a return on investment:
  - This return may come in the form of direct revenue earned by fees for EVSE use (but we can talk about this)
  - Or indirect return by enticing customers to stay in their businesses longer while they wait for their vehicle to charge or by attracting the plug-in electric vehicle driver customer demographic (it has been documented)
Other organizations have non-financial interests, such as supporting greenhouse gas or petroleum reductions, or furthering other sustainability initiatives.

Others organizations install EVSE to boost their public brand image.

Employers provide them as a benefit to attract employees.
Public Installation Considerations

- Establishing an EV charging infrastructure has unique challenges in that the public is not used to seeing EVSEs in public and may be unfamiliar with its purpose and use.

- Without specific signage to the contrary, ICE vehicles may park in spaces equipped with an EVSE because they are convenient and vacant.

- When an PEV arrives, the driver finds the space occupied and is unable to recharge.
Public Installation Considerations

• It is recommended that municipalities adopt specific ordinances to:
  – Prohibit non-EVs from parking in spaces marked for “EV Charging Only”
  – Require that EVs parked in spaces marked for “EV Charging Only” must be connected to the EVSE while parked

• It may not be feasible to install EVSE in existing accessible parking spaces because
  – that space then becomes exclusively designated for an EV and would remove one of the
  – accessible spaces originally required for the facility.
Disabled Parking Considerations

- Recommendations to enable persons with disabilities to have access to a charging station per ADA and IBC (International Building Code):
  - An accessible space is required to park, exit vehicle and access the EVSE. The accessible charging station space should be 96” wide 60” wide access aisle similar to a standard ADA space
  - Operable controls within 48” front and side reach range; and a 30” x 48” clear floor space is required
- If an accessible EVSE is located at a site with other amenities, such as a coffee shop, the space needs to be connected by a minimum 36” wide accessible route to the entry of the building. Maximum 1:20 (5%) running slope and 1:48 (2%) cross slope
Disabled Parking Considerations

• In general, for every 25 parking spaces, one parking space should be accessible. For every six parking spaces that are accessible, one parking space should be van accessible.

• See:
Public Level 2 EVSE Installation Costs

• Installation cost data for analysis is available for 2,479 units
• Average installation cost per unit for all publicly accessible Level 2 EVSE installed in EV Project markets was $3,108
• The five most expensive geographic markets had per unit installation costs over $4,000 ($4,004 to $4,588)
• The five least expensive geographic markets had per unit installation costs under $2,600 ($2,088 to $2,609)
• Similar to residential EVSE and direct current (DC) fast charger installation costs, AC Level 2 EVSE installed in California were the most expensive installations
Public Level 2 EVSE Installation Costs

- Labor was the primary geographic differentiator of EVSE installation cost
- Labor costs can be mitigated by wall mount versus pedestal installation
- Another factor that affected installation costs in different markets was implementation of Americans with Disability Act (ADA) requirements as understood by the local permitting authority having jurisdiction
National Look at Workplace Charging & Installation Costs
Nissan Leafs

• A sample of 622 Nissan Leaf drivers participating in The EV Project with access to workplace charging charged at work on 53,351 vehicle days between March 2011 and December 2013.

• Charging frequency and energy consumption by location for all EV Project Nissan Leafs in 2012 and 2013.
Nissan Leafs

- Charging frequency and energy consumption by location for workplace Leafs with access to workplace charging on days they went to work
**Nissan Leafs**

- Charging frequency and energy consumption by location for workplace Leaf vehicles with access to workplace charging on days when they were not parked at work sites.

![Bar chart showing charging frequency and energy consumption by location for Nissan Leafs. The chart indicates that 92% of frequency and 93% of energy are at home, while 8% of frequency and 7% of energy are other locations.](chart_image)
Percent of Days Leaf Daily Workplace Charging Behavior

- 22% of daily driving could not have been completed without workplace charging. Drivers used workplace charging to extend their driving range beyond what could be achieved from home charging alone.

- When considering vehicles with access to home charging, conventional thinking says most vehicles would charge at home every night and add workplace charging when necessary. However, this behavior only includes 56% of days (top off and enabling).

- 27% of days drivers only charged at work. Presumably, a driver would do this to reduce charging costs, because many workplaces offer free charging for employees.
Chevrolet Volts

- Charging frequency and energy consumption by location for all EV Project Chevrolet Volts in 2013
Chevrolet Volts

- A group of 96 Chevrolet Volts from The EV Project, whose drivers had the opportunity to charge at work
- Charging frequency and energy consumption by location for workplace EV Project Volt vehicles in 2013 on days they went to work
Chevrolet Volts

- Charging frequency and energy consumption by location for 96 workplace Volt vehicles on days when they were not parked at work sites
In aggregate, workplace vehicle drivers had little use for public infrastructure on days when they went to work.
Workplace EVSE Installation Cost Drivers

• Location Relative to the Facility
  – Typically installed in existing employee parking lots, normally at the rear of the workplace or at the side of the building
  – This typically puts the EVSE closer to the building’s power distribution panels
  – Shorter electrical conduit runs and, therefore, less expensive installation costs
  – Some workplace charging stations were installed in multi level parking garages
    • Also located away from the front of the building and were more likely to be nearer electrical service
    • These units typically utilized surface-mounted electrical conduit, which is less expensive to install than conduit buried underground
Workplace EVSE Installation Cost Drivers

• Wall-Mounted Installations
  – Greater freedom as to the installation location at a site led to more wall-mounted installations
  – Wall-mounted EVSE were typically less expensive to install, because they did not require underground conduit to supply power, which is typical for a pedestal unit
  – The average cost to install a wall-mount AC Level 2 EVSE was $2,035
  – The average cost to install a pedestal AC Level 2 was $3,209
Workplace EVSE Installation Cost Drivers

- Flexibility of the Installation Location
  - Ability to install the units with fewer accessibility requirements. For example
    - Typically there were few, if any, parking signage or striping requirements
    - ADA accessibility, including an accessible pathway to the workplace building, was only necessary if an employee was a PEV driver and required this accessibility
    - Units did not need to be in conspicuous locations
    - Public accessibility during hours outside of normal business hours was also not a concern
Workplace EVSE Installation Cost Drivers

• One workplace installation cost factor that did emerge over the course of The EV Project, was the cost to install additional EVSE
  - Many of the employers who provided workplace charge stations for their employees found that the offer of refueling commuter vehicles while at work (whether at a cost to the driver or free) encouraged more employees to obtain PEVs for their work commute
  - This put pressure on employers to add more stations, with the “easy” installations often being the first ones installed
  - Additional electrical service and parking places further from the electrical distribution panel usually were required for additional EVSE, which added to the cost of these subsequent installations
Workplace EVSE Installation Cost Drivers

- Workplace charging is the second most popular place to charge a plug-in electric vehicle (PEV), after home charging

- Key Conclusions
  - The average cost for installation of electric vehicle supply equipment (EVSE) at workplace locations was $2,223
  - The average installation cost for workplace charging EVSE was 75% of the average cost for all publicly accessible EVSE ($2,979)
  - 27% of workplace EVSE installed were wall-mount units, while 17% of the publicly accessible EVSE units were wall-mount units
  - Greater workplace EVSE location flexibility provided installation cost savings not typically available for public use
  - Future expansion of workplace charging EVSE represents a cost concern for employers, because expansions may require additional electrical service capacity

- Data is for 280 workplace installations
**Workplace Charging Installation Costs**

Workplace Charging Installation Costs

- Distribution of per unit workplace installation costs
  - 80% of the workplace stations were installed at costs that were below the average installation cost of $3,108 for stations installed for public use
Utility Demand Charges on AC Level 2 EVSE

- Some electric utilities impose demand charges on the highest power delivered to a customer in a month.
- Simultaneously charging plug-in electric vehicles via multiple AC Level 2 EVSE can create significant increases in power demand.
- These demand charges can have a significant impact on monthly electric utility costs, especially for small businesses.
- The increased charging rate allowed by many newer plug-in-electric vehicles (PEVs) will exacerbate this impact.
- A separately metered EVSE charging service may enable ACL2 charging site hosts to avoid most of these impacts.
